

# Soil-Set

**Soil-Set** on its own has many benefits but combined within a programme can enhance the efficacy of other products such as pesticides and nutrients. It is particularly beneficial when used with **TwinN**.

**Soil-Set** contains a unique combination of plant extracts, which have been scientifically developed over many years to improve soil, stress control and plant growth.

These plant extracts have a high steroidal saponin content and on contact with the soil has the ability to increase water and nutrient absorption.

Thus **Soil-Set** can enhance water and fertilizer penetration (especially in compact and alkaline soils) and improves the micro-organisms in the rhizosphere with the subsequent increase in the utilisation of organic matter.

This, together with the modification of the structure of the soil, can provide plants with increased moisture and nutrients, giving faster, stronger and healthier growth.

# Soil-Set - Working towards Sustainable Farming

Tricet UK Limited

**Soil-Set** is a unique formulation of nutrients and enzymes, which can enhance the activity, and populations of naturally occurring soil micro organisms.

This can lead to increased mineralisation and the release of more natural nitrogen for the next crop.

Liquid application supplied in 5 litre cans

For use on all soil types to improve crop growth and development.

Applied at minimum 750mls in a minimum of 100 litres of water per hectare. For re-seeding after grass increase rate to 1000mls per hectare.

Boosting nitrogen initiates a faster germination of weeds, giving an earlier opportunity for effective weed control, including Blackgrass.

Increased micro organism activity improves soil structure, encouraging a greater population of earthworms.

An all round general improvement of the soil structure considerably benefits root development and increases nutrient exchange, resulting in more vigorous and healthier crops which are more able to realise their true yield and quality potential.

**Soil-Set** is an organic product and has received a range of world wide approvals.

**Soil-Set** is compatible with most fungicides and herbicides, however it is recommended that a compatibility test be done before tank mixing.

**Soil-Set** is a natural adjuvant and can enhance the efficacy of herbicides.

**Soil-Set** can be applied pre seeding, early post emergence, pre harvest or post harvest, and can be tank mixed with Glyphosate herbicide

Maize field showing *Soil-Set* treated on the left hand side, and untreated on the right.

## Applying **Soil-Set** can provide:

**Improved** and enlivened soil structure

More natural nitrogen through increased mineralisation

Reduced residue for fungal pathogens to over-year

Improved weed control

Strong impact on take-all and root diseases and defence against nematodes and eelworms

Improved crop residue utilisation

Increased worm populations

Improved yield, quality and profit

Independent trials have shown the nutrient and enzyme combination in **Soil-Set** can break down crop residues by enhancing the activity of natural soil born micro organisms; as a result the decomposition of crop residues is accelerated.

**Soil-Set is manufactured by Improcrop Ltd  
Kentucky, USA.**

**Soil-Set is approved by the  
Organic Farmers and Growers  
Association.**
